**AIR CRASH INVESTIGATIONS, CAPTAIN LOST CONTROL The Crash of Kenya Airways Flight 507**-Hank Williamson, editor 2012-07-01 During the night of 04th May 2007, the B737-800, registration 5Y-KYA, operated by Kenya Airways as flight KQA 507 from Abidjan international airport (C te d'Ivoire), to the Jomo Kenyatta airport Nairobi (Kenya), made a scheduled stop-over at the Douala international airport (Cameroon). The weather was stormy. A number of departing planes decided to wait for the weather to improve. Kenya Airways, however, decided to depart. Shortly after take-off at about 1000 ft, the aircraft entered into a slow right roll that increased continuously and eventually ended up in a spiral dive. On the 5th May 2007 at approximately 0008 hrs, the airplane crashed in a mangrove swamp South-South/East of Douala. All 114 people on board were killed and the airplane was completely destroyed. The airplane crashed after loss of control by the crew as a result of spatial disorientation, after a long slow roll, during which no instrument scanning was done, and in the absence of external visual references in a dark night.

**Instructional Models in Computer-Based Learning Environments**-Sanne Dijkstra 2013-11-11 In the last decade there have been rapid developments in the field of computer-based learning environments. A whole new generation of computer-based learning environments has appeared, requiring new approaches to design and development. One main feature of current systems is that they distinguish different knowledge bases that are assumed to be necessary to support learning processes. Current computer-based learning environments often require explicit representations of large bodies of knowledge, including knowledge of instruction. This book focuses on instructional models as explicit, potentially implementable representations of knowledge concerning one or more aspects of instruction. The book has three parts, relating to different aspects of the knowledge that should be made explicit in instructional models: knowledge of instructional planning, knowledge of instructional strategies, and knowledge of instructional control. The book is based on a NATO Advanced Research Workshop held at the University of Twente, The Netherlands in July 1991.

**Boeing 737**-Graham M Simons 2021-02-28 The Boeing 737 is an American short- to medium-range twinjet narrow-body airliner developed and manufactured by Boeing Commercial Airplanes, a division of the Boeing Company. Originally designed as a shorter, lower-cost twin-engine airliner derived from the 707 and 727, the 737 has grown into a family of passenger models with capacities from 85 to 215 passengers, the most recent version of which, the 737 MAX, has become embroiled in a worldwide controversy. Initially envisioned in 1964, the first 737-100 made its first flight in April 1967 and entered airline service in February 1968 with Lufthansa. The 737 series went on to become one of the highest-selling commercial jetliners in history and has been in production in its core form since 1967; the 10,000th example was rolled out on 13 March 2018. There is, however, a very different side to the convoluted story of the 737's development, one that demonstrates a transition of power from a primarily engineering structure to one of accountancy, number-driven powerbase that saw corners cut, and the previous extremely high safety methodology compromised. The result was the 737 MAX. Having entered service in 2017, this model was grounded worldwide in March 2019 following two devastating crashes. In this revealing insight into the Boeing 737, the renowned aviation historian Graham M. Simons examines its design, development and service over the decades since 1967. He also explores the darker side of the 737's history, laying bare the politics, power-struggles, changes of management ideology and battles with Airbus that culminated in the 737 MAX debacle that has threatened Boeing's very survival.

**AIR CRASH INVESTIGATIONS, PILOT ERROR? The Crash of Ethiopian Airlines Flight 409**-Hans Griffioen, editor 2012-04 On 25 January 2010, at 00:41:30 UTC, Ethiopian Airlines flight ET 409, a Boeing 737-800, on its way from Beirut to Addis Ababa, crashed just after take-off from Rafic Hariri International Airport in Beirut, Lebanon, into the Mediterranean Sea about 5 NM South West of Beirut International Airport. All 90 persons on board were killed in the accident. The investigation concluded that the probable causes of the accident were pilot errors due to loss of situational awareness. Ethiopian Airlines refutes this conclusion. Other factors that could have lead to probable causes are the increased workload and stress levels that have most likely led to the captain reaching a situation of loss of situational awareness similar to a subtle incapacitation and the F/O failure to recognize it or to intervene accordingly. Ethiopian Airlines refutes the investigation. According to the airline the final report was biased, lacking evidence, incomplete and did not present the full account of the accident.

**Flight Failure**-Donald J. Porter 2020-05-19 A former aircraft engineer exposes the dangerous breakdown in airline safety due to lapses in maintenance and quality control. This book chronicles maintenance-related accidents caused by individual, corporate, or governmental negligence and brings the industry's current state of affairs into sharp focus. The author, a former aviation engineer specializing in aircraft fault diagnosis and maintenance planning, examines how failures of the smallest of parts have brought down airliners, explaining sometimes esoteric mechanical issues for readers with no technical background. Vividly describing the terror of accidents and close calls, the author then follows the painstaking investigations to determine causes. He focuses on maintenance errors, which rank as one of the top three causes of airline accidents, and points to the factors that have led to an alarming situation-- continued reduction of licensed mechanics, the shutting down of maintenance bases in the United States, and the outsourcing of maintenance to lowballing contractors. Outsourcing has forced thousands of licensed mechanics into retirement or different careers. For those mechanics still employed in the United States, the ever-present threat to their jobs does nothing to cultivate loyalty to an employer and devotion to a task. The Federal Aviation Administration, which should be overseeing quality control, is caught in a conflicted dual role--charged with regulating safety on the one hand and assuring the fiscal stability of airlines on the other. This disturbing wakeup call for improved airline safety standards highlights the critical importance of attention to detail. Porter recommends that the numbers and job security of airline mechanics be increased and that they be vested with an authority level akin to medical professionals.
